

## Detection of activated PKB/akt in EGF- and pervanadate-treated HepG2 cells

HepG2 cells were treated with 10 ng/ml EGF or 1mM pervanadate for the indicated times. Cell lysates of approx. 20.000 cells per lane were probed with the indicated monoclonal antibody at 0.5 µg/ml for 1h at 15-22°C (Film exposure time : 30 sec).
